

## Tri-layer Transport Cover

**Need:** Helicopters, engines and other high value assets are loaded on the back of a truck and transported over-the-road. It is common practice to wrap with plastic and use heat torches to “shrink-wrap” the entire object. This process is time consuming and unhealthy for those who must inhale the noxious fumes.

The fumes are so bad that the shrink-wrap process must take place outdoors regardless of the weather. Upon delivery, the shrink-wrap must be removed and discarded into a landfill. Shrink-wrapping is a costly and environmentally unfriendly process that no one likes.

**Solution:** A safe, padded, reusable cover that protects the object from the damage associated with transport. Covers are designed for the specific object. The cover installs in less than an hour.

**Description:** Three layer padded construction protects against flying rocks, inadvertent scratching, and wind damage. A second skin-like fit and tension fastening system secures the cover.

### Federal Acquisition of Green Products

This product developed by Kennon Products, Inc, will assist federal agencies complying with Executive Order 13514, "Federal Leadership in Environmental, Energy, and Economic Performance." The purpose of EO 13514 is to make various "green" initiatives a priority for federal agencies.

The Tri-layer Transport eliminates the process of shrink-wrapping, thereby eliminating the release of noxious fumes into the air that people breath.

The cover is reusable so it eliminates the disposal of large quantities of petro-chemical based material into landfills.
